SUMMARY

Senior Product Designer with 7+ years owning web and mobile products end to end, from user research and problem framing to shipped interfaces, across B2B and enterprise SaaS, healthcare, fintech and e-commerce. I run research myself and combine it with product data to shape decisions with product managers, engineers and data teams, for users from clinical research sites to families with little digital experience. With a Computer Science degree, I prototype in code with Claude Code daily, and I have designed and coded three AI products on my own. Results include a doubled e-commerce conversion rate, +15% add-to-cart, and admin changes cut from weeks to minutes.

HOW I WORK

- **Research-led decisions:** I run interviews, usability tests and surveys myself, combine them with funnel data and support tickets, and reframe requests around the goal when the evidence points elsewhere.
- **Quality and accessibility:** I review designs against defined criteria (heuristics, design system, WCAG accessibility, responsiveness, feasibility, copy, business fit), hand off with acceptance criteria, and check built screens against the design. For users with little digital experience, I use plain language and layouts that hold up when they raise the font size.
- **AI in the process:** I use AI for research, interface generation, validation prototypes and accessibility audits in code, mostly with Claude Code, and judge its output by the same bar as any design.
- **Mentoring:** I review other designers' work, give feedback aimed at their growth, and train PMs and designers to work with AI.

EXPERIENCE

Founder, Product Designer and Design Engineer | Independent AI products

Sep 2025 – Present | Part-time

Design and code three AI products on my own with Claude Code (TypeScript, React, Node.js, Mastra AI agents, PostgreSQL on Supabase), owning product design, architecture, tests and code review. Each has accounts, billing, and roles and permissions.

- **Nikki** (beta with 2 small businesses): a B2B AI agent on WhatsApp that collects customer feedback, sends promotions and grows Google review ratings. Designed the conversational experience and its trust patterns: messages for when the agent is unsure, a way to ask for help when it needs it, and an approval step before it messages a large group.
- Designed Nikki's web dashboards for campaign results and customer conversations. The beta is producing more 5-star reviews and private improvement feedback.
- **Pixel Perfect** (pre-launch), started at the Google Gemini Hackathon (April 2026): turns AI image output into true, consistent pixel art for indie game studios and artists, with a proprietary server-side algorithm.
- **Creative Marketing** (in development): AI agents that create brand-accurate ad creatives for marketing teams.

Senior Product Designer | BairesDev, client Syneos Health (StudyKIK)

May 2025 – Sep 2026 | Remote, US client

StudyKIK, part of Syneos Health, connects patients and research sites with clinical trials. I designed two of its products, web and mobile, with 4 product managers, business analysts, engineers and another designer, whose work I reviewed.

- **StudyEngage (B2B)** connects research sites with Syneos trials. It serves 5 user types with very different technical skills, and only admins can be trained, so every flow had to explain itself. Designed performance dashboards with role-based views: each site sees its own results, trial managers see a whole trial, and site networks see all their sites.

- Designed Study Home (every study, site and next action in one view), onboarding, site activation with upload of the required documents, and document management.
- Designed an Admin Profile Editor: internal admins now change profile questions in minutes, replacing a ticket, development and QA cycle that took weeks of team time.
- Launched an in-product intercept survey that exposed unknown pain points: users were confused by inviting and linking other users, which hurt profile completeness. This led to my redesign of site and investigator profiles, the core feature that matches sites with trials.
- **Patient Lobby (B2C)** matches patients with clinical trials. Led its full redesign, from competitor analysis and AI-assisted research on what motivates people to join a trial to wireframes validated with stakeholders.
- Created a Figma Make template that makes AI-generated designs follow the design system, using a tool I built with Claude Code. Wrote its usage guidelines and trained the PMs. It became the team's standard way to explore ideas (4 PMs, 2 designers): on-system, high-fidelity prototypes for stakeholders in hours instead of weeks.
- Maintained and extended the design system, fixed design-code inconsistencies, and used Claude Code to check prototypes could be built with common libraries before hand-off.

Freelance Product Designer

2025 | Part-time

- **Transferência Segura** (B2C fintech, web and mobile): as main designer, led 3 designers to take an escrow payment service for private vehicle sales from idea to a launched MVP in under 3 months. Mapped the legal steps with the founders and designed the 4-step flow (agreement, protected payment, identity and document checks, release) with real-time progress for both parties, under Brazil's data protection law (LGPD). Ran usability tests, gave the designers development goals and feedback, and used AI at every step.
- **Foodpass:** designed the physical-card activation flow and carrier letter. A Stark Bank security rule required a code sent to the card owner, so the code went in the letter, with plain instructions and a QR code to the app. **Tempo:** redesigned the landing page.

Senior Product Designer | Tempo Labs (Y Combinator)

Jan 2025 – May 2025 | Remote

- Designed web apps and SaaS products for 4 international clients at the same time, as their main design contact, including two AI products that launched: JustLiv (an AI calendar for booking children's activities) and RoofSilo (an AI CRM for roofers). Ran co-creation workshops with the founders and usability tests, shipped production React code with Tempo's AI builder, and reviewed the developers' work.

Senior UX/UI Designer | Foodpass (formerly Superopa)

Oct 2022 – Jan 2025

Grocery e-commerce for low-income families with little digital experience, which pivoted to a B2B2C food-benefits and benefit-card platform. Native mobile apps and web. Reported to the CTO.

- Set up UX/UI design from scratch and led it: design processes, a research repository and a design system used by 2 designers and 10+ developers across the Superopa app, the Foodpass app and the HR back office. Managed and mentored a designer and hired a second.
- Doubled the e-commerce conversion rate (app download to purchase) in one year through continuous, data-informed funnel improvements and moderated usability tests.
- Reframed the CTO's request for a promotions countdown timer around the real goal, more orders per day. Funnel analysis, past usability tests, support tickets, benchmarking and co-creation with stakeholders showed poor discoverability and led to automatic product lists on the home screen, a back office where marketing builds promotion lists, and new search (90% search success): +15% add-to-cart conversion.
- Designed the Benefits Card app (card infrastructure from Stark Bank) and its HR back office, built in about 2 months. Interviews showed factory-floor workers barely used technology beyond calls and WhatsApp, so login uses CPF (Brazil's taxpayer ID) and an SMS code, with a guided tutorial. Cut the MVP to virtual cards in Google and Apple Wallet and checked every built screen against the design. The card opened sales to companies with 500+ employees.

- Designed the HR back office. Interviews showed HR teams were overloaded at month end and forgot to add or remove employees, so I designed per-employee credit reversal and top-up before launch; when the problem appeared in the beta, it shipped right away.
- Built company, marketing, UX and buying dashboards in Looker Studio with BigQuery SQL, as part of the data team. The main dashboard linked a churn spike to flat revenue and set the next product priorities. A service blueprint of the buying and warehouse process led to tools that cut stock losses.

UX/UI Design Tutor | Coderhouse

Sep 2023 – Jan 2024 | Part-time

- Mentored 30+ UX/UI students through reviews, critiques and 1:1s. Rated one of the top tutors in student evaluations.

Product Designer | Casar.com

Dec 2021 – May 2022

Wedding platform where about 30,000 couples build their wedding sites.

- Redesigned photo editing in the site editor, the #1 user pain point, affecting 16% of couples (5,000 of 30,000) daily.
- Found the main causes of churn through semi-structured interviews with wedding planners and large Typeform surveys of couples, analyzed in Google Data Studio alongside OKRs and product metrics.
- Helped build the product strategy and roadmap, moderated usability tests, and cut development time of key features from months to weeks by designing within engineering constraints.

UX/UI Designer | Radix Engineering and Software

May 2021 – Dec 2021

- Designed operational dashboards and native mobile apps for enterprise clients including Vale, Braskem, Itaú, Modec and Sotreq, such as equipment monitoring at a Vale mining site. Built the component library v1.0 and ran Figma workshops for the design team.

UX/UI Designer and Front-end Developer | Aion Solution

Apr 2020 – Apr 2021

- Researched, designed and built e-commerce sites (HTML, CSS, JavaScript, VTEX) for clients including Urbane and Stance Socks Brazil, and turned store setup into reusable components that cut each new store from months to 2 days.

President and UI/UX Manager | Conpec, UNICAMP's student-run consultancy

Apr 2017 – Dec 2019

- Managed a team of 6 designers on parallel client projects as UI/UX Manager, and more than doubled profitability by improving how clients valued the work. As president, led the ~60-member company and grew annual revenue ~30% to almost R$80k.

EDUCATION AND LANGUAGES

MBA in UX Research and Design Leadership, UNIFATEC with Toronto School of Management | 2023 – 2025

B.S. in Computer Science, UNICAMP, one of the best universities in Latin America | 2017 – 2022

Product Master (product management), PM3 | in progress, expected 2027

User Experience Design, UX Unicórnio | 2020 – 2021

Certifications: Google Gemini Hackathon (April 2026), AI Agents Fundamentals by Hugging Face (2025)

Languages: English (fluent), Portuguese (native)
